	Handcrafted Features	Handcrafted Features	Ours	PTV1	PTV3	PTV3	PQ	SQ
Worst-case campuse instance (no EAD) co- likehood vs. the numbe of different semantic thresholding	88.7	88.7	95.6	78.4	80.2	88.9	88.7	88.7
Avg. PQ over all campuses	88.7	88.7	95.6	88.7	88.7	95.6	88.7	88.7
Computational complexity vs. number of windows	88.7	88.7	95.6	88.7	88.7	95.6	88.7	88.7

Table 6. Ablation study on feature learning methods on the PlanCAD dataset. We compare our dense point sampling primitive features with the hand-crafted feature representations of SymPoint. All methods utilize the same decoder architecture to learn intermediate features.

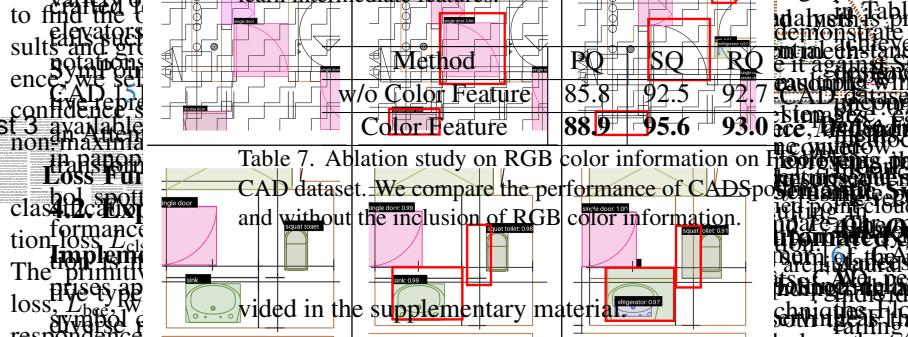

Table 7. Ablation study on RGB color information on ImageNet and CAD dataset. We compare the performance of CADspotNet with and without the inclusion of RGB color information.

4.5. Ablation Studies

carves! It is also possible to define boundary conditions, specifying what happens outside the domain. The code is parallel and can make use of multiple GPUs, using OpenCL or CUDA. The code is also designed to run on clusters.

3.3. Sliding Window

During our first year, we have been able to identify the main points of interest in the study of the development of the primary visual system in the macaque monkey. We have found that the primary visual cortex is organized into a series of parallel columns, each of which receives input from a single retinal ganglion cell. The primary visual cortex is also organized into a series of parallel columns, each of which receives input from a single retinal ganglion cell. The primary visual cortex is also organized into a series of parallel columns, each of which receives input from a single retinal ganglion cell.

Dense vegetation can tolerate inundation better than sparse vegetation.

limits to the development of the market economy between the two world wars.

fects on a small number of variables, such as the relationship between the number of hours spent on the Internet and the number of hours spent on television.

segmentation. In symbolic systems, the segmentation of the space is done by means of feature descriptors, such as shape and structure, coupled with graphic

Consequently, matching symbolic features may be more effective than matching visual features.

fixed typesetting techniques, such as the *monospace* and *mono* environments, and the *verb* environment for displaying code snippets. The *verb* environment is particularly useful for displaying snippets of programming code, as it preserves the original syntax and structure of the code.

However, traditional symbol spotting methods are primarily
